ENVIRONMENTAL CONSCIOUSNESS – PROTECTION OF EARTH

A. Adamkevych

*National Technical University
«Kharkiv Polytechnic Institute»,
Kharkiv*

The problems of preserving the environment and natural resources are becoming more urgent, due to the increasing rates of growth in industry. In this paper, solutions to this problem will be considered.

It should be noted that ecological consciousness is an understanding of the place and role of a person in the environment and an assessment of his own influence on nature. It should be formed from the childhood by parents and teachers at the school.

The third Saturday of April is officially recognized by the All-Ukrainian Day of the Environment. In schools and universities are held, as a rule, various thematic events. However, unfortunately, people are reminded of the great nature importance for humans only in this day.

In my opinion, the Ministry of Education and Science of Ukraine, as the agent of management, must conduct practical lessons in the course of natural science, which not only carry out writing of essays but also, for example, lessons in which students could plant trees, care for flowerbeds or houseplants and green educational institutions.

Also, one of the main current problems is the lack of awareness of the limited natural resources by the youth. Therefore, teachers should draw the attention to this aspect, and parents in turn should bring their children to economic use of nature.

If we provide the ecological consciousness from the childhood and realize the results of our actions, then we will expect to see the great improvement of the ecological situation in a few years.
