

PROBLEMS OF INTRODUCTION OF INNOVATIONS ARE ON INDUSTRIAL ENTERPRISES

Vasytsova S.O.

National Technical University «Kharkiv Polytechnic Institute», Kharkiv

Scientists and economists-practices spare much attention to the problem of decline of innovative activity in the state. Analytical work is conducted in relation to accessible statistical indexes, recommendations are developed and given.

If to detect to the statistician, that she is given by Government service of statistics of Ukraine, then it appears that innovative activity takes place. The scientific opening continue to take place, inventions are patented, is science, though suffers from the lack of money, however stands in place. Numerous developments of foreign scientists are accessible, by an eventual end, such widely used phenomenon is possible. But the question of absence of products of base innovations in Ukraine remains actual.

The degree of development of innovative technologies researchers measure through the innovative parameters of certain industries and types of products, that have international meaningfulness. Necessary data are contained by statistics of almost all states of the world, that, except producing of innovative products and technologies, removes them *запитаність* by a world market, and thus is confession and meaningfulness.

In relation to home commodities present at the internal market, it maybe to establish:

- home hi-tech products yield to the imported commodities, that have a powerful productive base and, comparatively, considerably more subzero prime price;
- hi-tech corporations do not find out the personal interest to forming of scientific and production structures, economically proof, apt at development own ideas and next reproductive cycle;
- for the modern structure of hi-tech complex of Ukraine weak development or complete absence of many elements is characteristic.

As stated above, economic development is slowed, when technologies become antiquated. Just the same processes are processes of deceleration of industrial development, and consequently – and changes of structure of economy, took place in Ukraine for the last two decades. Innovative activity as state ideology – for the leaders of the state, innovation – as a guarantee of increase and business safety – for businessmen, embodiment of scientific idea – as sense of existence of scientific institutes and scientists, such the vision of further development must become.
