

USE OF PRESENTATIONS AS A PART OF MODERN TEACHING TECHNOLOGIES

Karachova D., Myroshnychenko V.

National Technical University «Kharkiv Polytechnic Institute», Kharkiv

This issue is extremely relevant, because it provides an opportunity to explore modern teaching methods and their quality. Global changes in the world dictate new requirements for the quality of teaching. This fact contributes to the development of new multimedia technologies that can be used in lectures and practical classes in higher educational institutions.

The development of modern global trends leads to the actualization of the field of education and science. An important task for higher educational institutions was and still is to provide students with the most up-to-date knowledge, which they can use both in everyday life and to be competitive in the modern labor market.

Involvement in multimedia teaching formats encourages students to develop their technical skills and create individual presentations on the topic studied. Thus, students have the opportunity to learn how to make informative and creative presentations during their studies at higher educational institutions, which will significantly help them in their future profession, because all big modern companies more or less use the presentation format to conduct important negotiations involving a large amount of information.

Modern education should aim to provide students with the most important knowledge and skills that would be useful in their professional lives and career development in the future.

It is important to note that in order to study this topic, it is also necessary to pay attention to the experience of Western higher educational institutions, which are currently setting trends for global changes in the field of education and science. Their experience is invaluable, as it provides an opportunity to see which technologies really work best for students and can be useful for them in the future.

The modern world is no longer imaginable without the use of technology, and modern education can no longer work in the old format. And the involvement of various multimedia technologies will only significantly improve the quality of learning. Students should learn how to use all the tools needed for their future profession during their classes at the university as this will significantly help them to be skilled professionals.
